A complex of problems is not solved in technical regulation of construction. This includes the list of regulatory documents of compulsory application is not revised yet. The issue of developing high-quality regulative documents for the construction field is of great importance, because their fulfillment guarantees the safety of the population.

The project of this list consists of 76 documents; that's 15 less, than in the existing list. The reasons for reducing the number of documents are doubtful. In the list project there are no standards for building materials.

All the documents concerning the rules of work execution are also out of this list, though the documents affecting the building safety should be included it the compulsory list.

It is offered not to make a list of documents. It is enough to enumerate all the reference documents in project documentation, which is subject to inspection by the building supervision agencies as compulsory. There will be no need for the additional list of documents for optional application.

Key words: building regulations, technical regulations, project documentation, list of standards, regulatory documents, security of buildings.
